

Fire Doors and Security Doors

When safety and design go hand in hand

It should be easy to choose solutions that protect people, buildings and assets – without compromising on aesthetics and flexibility.

With our security doors, we combine fire and safety certifications, so our customers have much more freedom to put together exactly the solution that meets their needs.

Some doors come with an upper section that can be opened when needed, which provides great flexibility in relation to the door opening. The doors can of course be supplied with different surfaces and in any desired RAL colour to match the architectural requirements for design and expression.

- ✓ 22 new safety doors – including 13 combined fire and safety doors
- ✓ Choice of safety classes RC3 and RC4
- ✓ Choice of fire resistance EI₂-30, EI₂-60 and EI₂-120
- ✓ Available as single- or double-leaf models with 62 or 100 mm insulation

Why is it important?

The RC certifications ensure that the doors are tested and approved to withstand burglary attempts with everything from hand tools to powerful power tools.

The EI fire certifications guarantee that the doors can withstand fire, smoke and heat for up to 120 minutes – thus providing valuable time for evacuation and rescue.

Our solutions are approved for use in all industries – from industry and business to environments with the highest hygiene requirements, such as in food and pharmaceutical production.

With the new product ranges, we make it even easier to choose a door solution where safety, functionality and design go hand in hand. <https://dan-doors.dk/en/vare-kategori/brand-sikkerhed/>
